## HOW I BUILD AI PRODUCTS

| Measure it | Price it | Govern it | Ship it |
|---|---|---|---|
| Langfuse traces and scored evals. | Cost and latency set on day one. | Named human approver on AI output. | Specs and UAT to production. |

## ENTERPRISE AI IN PRODUCTION 01-04

Each project: Problem → What I did → Result | **Highlighted** = measured outcome

### 01 Agentic Medical Affairs Research Assistant

**Role:** Technical PM, 8-member team | Life-sciences client | AWS Bedrock

**PROBLEM** Medical-affairs teams spent hours stitching evidence across PubMed, ClinicalTrials.gov and Veeva.

**WHAT I DID** Owned vision and success measures; shipped multimodal RAG with SSO and access controls; tuned prompts and retrieval for latency; ran weekly client leadership demos.

**RESULT** **Beat the 10-min SLA by 50%** (sub-5-min average); every milestone on or ahead of schedule.

### 02 Resource Management Group (RMG) Agentic Copilot

**Role:** Product Manager | Internal | LangGraph, Azure OpenAI, Langfuse

**PROBLEM** Staffing data sat in 3 internal databases (resources, projects and skills, new resource requests); leaders waited on analysts for every report.

**WHAT I DID** Prioritized multi-agent text-to-SQL across all 3 sources; built a weighted matching framework (JD, skills, location, experience, education) placing bench talent into open RRs.

**RESULT** **~60% fewer custom BI report requests** at **Rs. 3.5 per query**; bench-to-RR matches on one explainable score.

### 03 Spec-Driven Development (SDD) with Claude Code: the company's first rollout

**Role:** Sole offshore PM & Scrum Master | US healthcare benefits platform, Dynamics 365 to GCP re-platform | Claude Code, GitHub

**PROBLEM** After UAT the client re-platformed Dynamics 365 to GCP; the team needed AI-speed delivery without losing control.

**WHAT I DID** Customized the CTO office's AI SDLC toolkit to our project so SDD covers the **entire SDLC**: spec, design and plan approval gates, build, test, security, review and release. Set RACI for 8+ roles, DoR/DoD, branch protection, required CI checks and CODEOWNERS, so every AI-generated change has a named human approver.

**RESULT** First full cycle complete: **5 specs developed, tested and deployed**; **9 specs business-approved**; **30 people trained** on the end-to-end SDD process; defects caught at spec review, not QA. Before SDD: **400+ stories in 16 sprints**.

### 04 Performance - Analytics - Reporting (PAR): AI Reconciliation of Client Investment Reports

**Role:** Product Owner, team of 4 | US investment manager | Azure OpenAI, Python, Langfuse

**PROBLEM** Analysts hand-checked every Excel and PDF report the firm sends its clients, where one missed cell is a client-facing error.

**WHAT I DID** Defined vision and backlog: the engine aligns report structure, then AI autonomously reconciles 4 layers:

| Styling & Formatting | Headers & Structure | Values & Data Content | Formulas & Logic |
|---|---|---|---|
| Font and typography, cell fills and colors, text alignment, number formatting, merged cells, borders and gridlines, hidden elements | Header names, column sequence, blank spaces, total rows | Decimal precision, text vs. numbers, sign consistency, hidden spaces, date formats | Hardcoded overwrites, formula range, error flags |

**RESULT** **80% of reconciliation automated**, **138 of 146 errors caught** in client testing, and cleared the client's formal Information Risk review for production.

## AGENTIC AI PROTOTYPES FOR BANKING & FINANCIAL SERVICES 05-06

Built as reusable BFS sales accelerators

### 05 Agentic SMB Loan Underwriting

**Role:** Product Owner, MVP to POC | Azure OpenAI, Gemini

**PROBLEM** Underwriters re-key tax returns and bank statements, and ratios miss live risks such as regulatory fines.

**WHAT I DID** Designed a 5-agent flow (eligibility, extraction, financials, industry sentiment, decision) and a **9-metric weighted risk score** (0-100).

**RESULT** Straight-through approval for low risk, **human review for borderline cases**, audit-ready PDF rationale.

### 06 Personal Finance Orchestration Agents

**Role:** Product Owner, MVP to POC | GPT-4, DistilBERT

**PROBLEM** Bank customers see transactions, not guidance on what to save, cut or invest.

**WHAT I DID** Orchestrated 5 agents (classifier, budget guardian, anomaly detection, savings scout, investment advisor) on a **hybrid rules + RAG engine** with live market data.

**RESULT** Insights route to action, approval or fallback with an audit trail per agent step.

## SCALING AI BEYOND MY OWN PROJECTS

| GenAI Accelerators | Tool Selection | GenAI Community Charter | Responsible AI |
|---|---|---|---|
| Led **6 reusable GenAI accelerators** and the AI Accelerator website sales uses with clients. | Benchmarked **12 AI coding assistants** into a decision matrix; adoption KPIs in Power BI. | Co-authored the governance model: daily calls, monthly reviews, **quarterly hackathons**. | **9-parameter GenAI governance framework** benchmarked across 10 IT firms (MBA internship). |

**My path:** Computer-vision engineer (2021-23) → IIT Madras MBA, GenAI governance (2023-25) → AI PM, agentic AI in production (2025-now)

**MBA, IIT Madras** (CGPA 8.89) | **B.Tech Mechatronics**, MIT Manipal (CGPA 9.61) | **Microsoft AI PM Professional Certification**
